

Abstract

Video simulation Method and Program

In a method of providing a video simulation on a computer, parameter selection options (S1-S7) and possible parameter values (I1-I6; F1-F9) are displayed, and are selectable by the user. The outcome of the simulation is determined according to the combination of parameters selected by the user, user interaction during a simulation video clip, and additionally according to a random or pseudo-random determination. An outcome video clip (V) corresponding to the outcome is selected and displayed.
